

Team 4: Rutgers Club Field Hockey

Daniel Tlatenco, Zoila Martinez, Dennis Chen, Cayden Drumeler, Amelie Genao

Company Access: Rutgers Club Field Hockey

- **Primary Contact:** Club President Eda Tsakaya
- **General Member Contact:** “Sunny”
- Contact made primarily through email and Zoom
- Team-wide Google Form Survey sent out through RCFH GroupMe chat
- Access also included organizational details shared by the executive board (structure, roles, and expectations)

Primary Output Problem: Lack of In-Game Cohesion

Stems From

- Inconsistent practice attendance
- Ranges in commitment levels between members
- Lack of chemistry
- Practicing with players who may not necessarily be their on-field teammates
- Focus on a welcoming environment where attendance is considered “flexible”

Results In

- Avoidable in-game errors, misunderstandings, mismatched play styles and strategies → Losing Games
-

Data Collection Methods

Mixed-methods approach: Anonymous Survey

Quantitative:

- Multiple Choice Questions
- Attendance Rate (I “attend all”, “most”, “half”, or “none”) for both practice and games.
- Scale Questions: 1-5 (1 being “Not affected at all” and 5 being “Greatly affected”)
 - “To what extent do you feel that team chemistry during games is affected by inconsistent member attendance?”
 - “To what extent does flexibility and low pressure environment of the organization affect inconsistency?”
 - “To what extent do you feel that if there were set expectations for all members inconsistency would lessen?”
 - “I believe practices are efficient and help maximize in-game performance.”

Qualitative:

- Open-ended questions:
 - “Do you believe that the organization's flexibility and low pressure environment limits team chemistry?”
 - “What motivates you to come back to each practice or game?”
-

Summary Of Interview Data

Eda (Club President): Acknowledged a symptom of their core issue; poor team cohesion during games but did not identify the root cause.

- Recommended improving cohesion but did not link it to practice attendance.

Eda (Club President)

Sunny (General Member): Directly identified inconsistent practice attendance as the core problem.

- Stated that members who skip practices still play in games, forcing the team to adapt to unfamiliar styles mid-game.
 - Cited a lack of clear, enforced rules as the cause and suggested requiring attendance at practices to play in games.
-

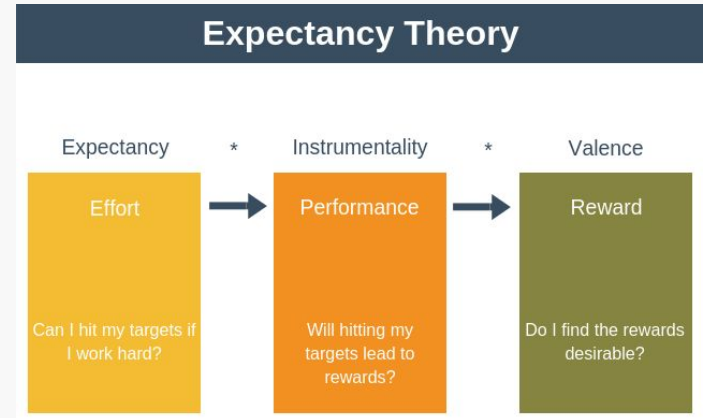

Course Concept: Broken Expectancy Theory Links

Unclear performance-reward link: Attendance at practice (performance) is not clearly tied to playing time in games (reward).

- Leads to inconsistent attendance, which weakens on-field cohesion and team effectiveness.

Initial Proposed Solutions:

- Implement a clear policy
- Establish a direct instrumentality link
- Clarify expectations and incentivizes commitment, aiming to improve consistency and team cohesion.

Method for Quantifying the Output Problem

We sent out an anonymous survey to the team to quantify and understand the problem from their perspective

- Calculated severity metrics using averages of perception-based questions scaled out of 5
 - Identified expectancy theory indicators and created measurable survey questions for each one (Ex: “To what extent do you feel that team chemistry during games is affected by inconsistent member attendance?” effort→performance)
 - Analyzed attendance frequency to quantify inconsistencies between games and practices
-

Contextualizing the Severity

Attendance:

- Most reported not attending practice at all or attending very few (63.6%)
- Majority reported attending most or all games (73.2%)

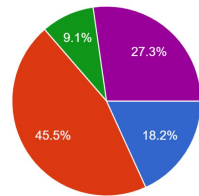

This gap highlights that players value the games (reward) but not practices (effort)

Player beliefs:

- Most agreed that the attendance gap impacted team chemistry (Avg agreement = 3.45/5) and that having clearer expectations would reduce inconsistency (Avg agreement = 3.64/5)

Players currently don't believe practice attendance leads to better performance or rewards because game time isn't affected

How would you rate your game attendance?
11 responses

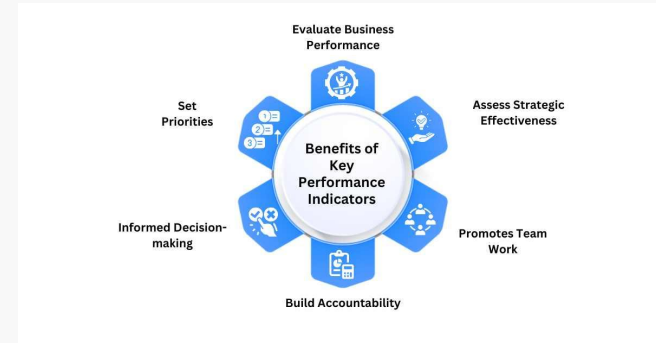

- I attend all games
- I attend most games
- I attend about half of the games
- I attend very few games
- I attend no games

Recommendation

Implementing a clear and measurable Key Performance Indicator system (KPI)

- Define what the performance expectations are and how they link directly to rewards
 - Starting positions, Playing time etc.
- Allows for all links of the expectancy theory chain to become stronger
 - Allows general members to gain confidence that the effort they put in will translate to rewards they see on and off the field
- Implementing KPI's as part of their process would be beneficial for the team

Examples:

FC Barcelona

- Measured performance, kept record of the goals, assists and injuries
- 30% reduction in injuries

Golden State Warriors

- Tracked their player performance in every game
- Also tracked players performance of opposing team and compared

Amazon

- They track company wide sale growths to advertising goals
- Make expectations measurable allowing partners and employees to see how their efforts connect to the outcomes.

These examples demonstrate how clear performance metrics improve consistency, alignment, and outcomes, exactly what RCFH could gain from a KPI system!
